

Arthroplasty

Joint replacement; the mutilated articular surfaces are removed and replaced with artificial joints. In some cases it is possible to partially remove the articular surface and place a partial artificial joint.

The majority of the surgeries consist of hip and knee joint endoprosthesis but we also perform shoulder, elbow and finger joint replacement surgeries.

In addition, we have specialised in complex repeat surgeries for already prosthetic joints.

We use modern, evidence-based treatment methods. The endoprostheses used have high survivorship in international registers.

Monitoring and checking postoperative patients takes place at the outpatient clinic.
