

Vaccination against hepatitis B (1 dose) at the customer's location

You can vaccinate against hepatitis B to prevent infection.

The vaccination, consisting of three doses, ensures a long-term effective protection. Viral hepatitis B is a nonpurulent liver inflammation caused by the hepatitis B virus (HBV). The hepatitis B virus is highly contagious. The hepatitis B virus is transferred via blood transfusion, injecting drugs with shared syringes, tattooing, piercing, stabbing injuries, using household items contaminated with blood in case of microtraumas of the skin and mucous membranes (toothbrushes, shavers). Unlike viral hepatitis A, viral hepatitis B may cause chronic liver inflammation.
