

Neuroimmunology

Multiple Sclerosis is the main field of activity. The number of patients is increasing, and we are the second largest centre in Estonia dealing with the treatment of multiple sclerosis.

We use all modern treatment methods. Three physician and three nurses monitor patients with multiple sclerosis. In addition to multiple sclerosis, physicians deal with the diagnosis and treatment of different neuroimmunological diseases of the brain and peripheral nervous system caused by autoantibodies. We utilise plasma apheresis, immunoglobulin treatment and cytostatic treatment.

In most cases, treatment is performed in day treatment at the neurology department. A neuropsychologist, clinical psychologist, speech therapists and a physiotherapist are also specialised in this group of illnesses.
