## Pheochromocytoma or adrenergic tissue or medullary thyroid cancer scintigraphy

**This examination is used to evaluate the spread of pheochromocytoma, neuroblastoma or medullary thyroid cancer, to detect relapses and plan <sup>131</sup>I-MIBG treatment.**

The examination involves intravenous injections of a tissue-specific substance, meta-iodobenzylguanidine (MIBG), marked with radioactive iodine (<sup>123</sup>I). This examination shall be performed with a hybrid imaging device, a gamma camera / computed tomography device (SPET/CT). You can come to the examination only with a specialist's referral.
